

M2.7. b: jQuery Events

What are events in jQuery?

Events : -

We have the ability to create dynamic web pages by using events. Events are actions that can be detected by your Web Application. All the different visitor's actions that a web page can respond to are called events. An event represents the precise moment when something happens. The term "**fires/fired**" is often used with events. When these events are triggered you can then use a custom function to do pretty much whatever you want with the event. These custom functions call **Event Handlers**.

Examples:

- moving a mouse over an element
- selecting a radio button
- clicking on an element

Mouse Events	Keyboard Events	Form Events	Document/Window Events
click	keypress	submit	load
dblclick	keydown	change	resize
mouseenter	keyup	focus	scroll
mouseleave		blur	unload
